Pitch Script & Judge Q&A

DAMI

دَمي

The right blood unit, to the right hospital, before it's requested… and by drone when there's no time

A 5-minute pitch script split by the second, live-demo steps, and the most likely judge questions with suggested answers.

> **Because blood that arrives late… doesn't arrive.**

1 Pitch script (5 minutes)

Time	Segment	What we say / do
0:00–0:30	**Opening (the story)**	"5 p.m., an accident on the Airport Road. A hospital needs 6 units of O negative, now. The car from the blood bank needs 34 minutes in traffic. In severe bleeding, every minute matters."
0:30–1:10	**The problem**	"It's not only accidents. Blood expires: platelets last only 5 to 7 days. So one hospital runs short while units expire at another, and general donation drives don't target the missing type."
1:10–2:00	**The solution**	"We are NEXORA, and this is DAMI: a three-layer platform. It forecasts demand and rebalances stock before it's wasted, calls the right donor, and in emergencies launches a cooled medical drone from the blood bank to the hospital in minutes."
2:00–3:00	**Live demo**	Open the simulator → Emergency drone → "Find best source" → point at drone vs car → "Launch drone now" → point at 4 °C → press "Simulate cooling failure" so the judges see the alarm → switch to Mass casualty.
3:00–3:45	**Business model**	"Our customers are hospitals and the blood bank. We earn from an annual hospital subscription, a fee per emergency flight, a national dashboard contract and donor-app sponsorship. Gross margin in year 3 is about 72%."
3:45–4:30	**Plan & realism**	"We start with software in 3 hospitals, then a pilot drone route approved by the Civil Aviation Regulatory Commission. We know licensing is the biggest challenge, so our plan creates value before the first flight."
4:30–5:00	**Ask & close**	"We are asking for about JOD 90,000 in seed funding and a pilot partnership with a blood bank and a hospital. Because blood that arrives late… doesn't arrive. Thank you."

Pitch tips: Open with the story, not the tech. Have the simulator running before you walk in. Raise the regulatory challenge yourself before the judges ask. End on one strong line.

2 Expected judge questions

Q: Are drones allowed in Jordan?

A: They need permits from the Civil Aviation Regulatory Commission and security authorities. That's why we start with simulation and software, then one approved pilot route, and our first year doesn't depend financially on flying.

Q: How do you keep blood safe in flight?

A: A certified box holding 2–6 °C, a logger reporting every second, an instant alarm, and a full temperature log delivered with every shipment. Any out-of-range shipment is flagged and not used.

Q: What if a drone falls?

A: Emergency parachute, automatic return on link loss, routes away from crowds, liability insurance, and a licensed pilot monitoring every flight.

Q: Where will the data come from?

A: The prototype runs on realistic synthetic data. In the pilot we connect partner hospitals' stock under a formal agreement, with encryption and consent.

Q: Why no break-even within 3 years?

A: Drones and licensing are an early investment. In the optimistic scenario we break even in month 27. To cut risk we fund the pilot fleet with a health grant or donor partner, so the software side turns profitable faster.

Q: How are you different from Zipline?

A: Zipline is a delivery company. DAMI is a full decision platform: it forecasts, balances and calls donors, and the drone is its emergency layer. We could partner with any drone operator in future.

Q: Who pays?

A: Private hospitals first because they decide faster, then the Ministry of Health through the national dashboard contract, and companies sponsor the donor app as CSR.

Q: What have you actually built?

A: A complete working simulator: stock dashboard, forecasting, donors, emergency drone request with temperature tracking, and mass-casualty mode, plus the business model and feasibility study.

Q: How many units does a drone carry?

A: 4–6 units per flight in the pilot, enough for the first emergency need until the larger batch arrives by car.

Q: What are your success metrics?

A: Units saved from expiry, minutes saved in emergencies, share of shipments within safe temperature, and number of active donors.

Financial figures are preliminary planning assumptions set by the team, not market research or supplier quotes, and must be validated before any decision. “Not available in Jordan” means no equivalent was found in preliminary research. The simulator uses synthetic data and schematic locations.
